

What We Do

- Maritime Ka - Band
- Maritime Ku - Band
- Maritime New Flat antenna "Kymeta"

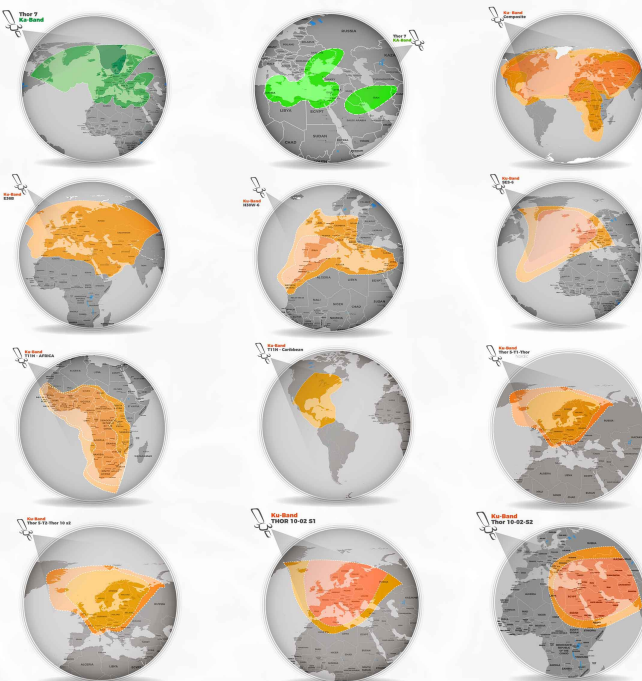

We do have a maritime satellite coverage and service over :

- All Arabian Gulf
 - All Red Sea
 - All Mediterranean
 - All Africa sea around Africa
 - The North Sea
 - All North Atlantic
 - And all Caribbean Sea
 - The Kymeta ku - the coverage is worldwide as we are using other satellite type - HTS
 - The service or the access is more expensive
 - The service is on one antenna max 4 Mbps/1 Mbps and volume based
- All Using the regular dome antenna in Ku-band

Who We Are

A Belgian, European private satellite operator, offering internet connectivity for the land fix, for the transportable usage, for the vehicle, but here mainly we are promoting the maritime solution & service.

The maritime internet speed available can be up to 50 Mbps download and 10 Mbps Upload

We even can do more, but this need to be analyses on a case by case. This work with the conventional technology, the tracking three axes antenna and a dome over the antenna.

The antenna on board of the vessel can be from 60 cm up to 1.2m size in Ku-band.

In ka-band (higher frequencies (+/- 30 Ghz) the antenna size will be a 60 cm, easier to install, a bit cheaper than the Ku system in term of investment and installation.

The satellite for the Ka-band is restricted to the Mediterranean Sea (for now) and the capacity is really much higher - like 50 Mbps, the subscription is cheaper- this is the benefit of the Ka-Band.

The Kymeta Flat Antenna (New Techno)

Using the Kymeta new flat antenna with one (1) antenna we can reach 4 Mbps received and 1 Mbps transmit - this antenna work and operate in Ku-band (14 Ghz)

The combination of two(2) antennas or four(4) antennas makes the internet on board of the vessel much more powerful and the speed can be much higher.

This flat antenna has no mechanic, no complicated system on board, the antenna is tracking and finding the satellite electronically and automatically using a new beam forming holographic technology.

- o The satellite coverage is more worldwide.
- o The HTS satellite offer a good connectivity in most of all the region.
- o Capacity up to 4 Mbps / 1 Mbps using a single flat antenna

Maritime and Ka-Band

We are supplying equipment in Ka-band which is also a new techno and new satellite very powerful (HTS)

- o This is for the Mediterranean coverage
- o High throughput satellite (HTS Ka-band)
- o Easily 50 Mbps on board in Ka-band

Maritime and Ku-Band

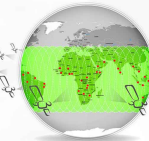

We are mainly supplying the Ku-band all over a wide coverage. The hardware in general cost 25000 USD

- o For the dome antenna or the Flat Kymeta antenna
- o And the service is either volume based OR unlimited
- o Either shared access unlimited (10:1, 5:1) OR dedicated (1:1)

O3B MEO

We also offer the O3b MEO satellite service up to 1 Gbps for a cruise boat

- o This O3b techno is very special and unique
- o Very powerful
- o And worldwide coverage (important)
- o Able to serve up to 5000 users easily

GlobalTT Maritime Services

For Our client, the boat, the vessels, the offshore platform, we can offer the any maritime services :

- o Private yack
- o Offshore oil and gas platform
- o Big private boat
 - o Number of people on the boat will be usually up to 2 to 50 persons
 - o But we do have another technology to serve 5 000 if necessary.

All the others techno we are referring too are only for the

Arabian Gulf The Red Sea The Mediterranean The North Sea
Atlantic and Caribbean
